# Firmware Upgrade Application User Guide

---

Application Note for 32-bit NuMicro® Family

---

## Document Information

<b>Abstract</b>	Demonstrate how to implement the firmware upgrade application under the M2354 architecture.
<b>Apply to</b>	NuMicro® M2354 Series.

<b>1 SAMPLE CODE INTRODUCTION .....</b>	<b>3</b>
<b>2 THE OPERATION OF FIRMWARE UPGRADE SAMPLE CODE.....</b>	<b>5</b>

## 1 Sample Code Introduction

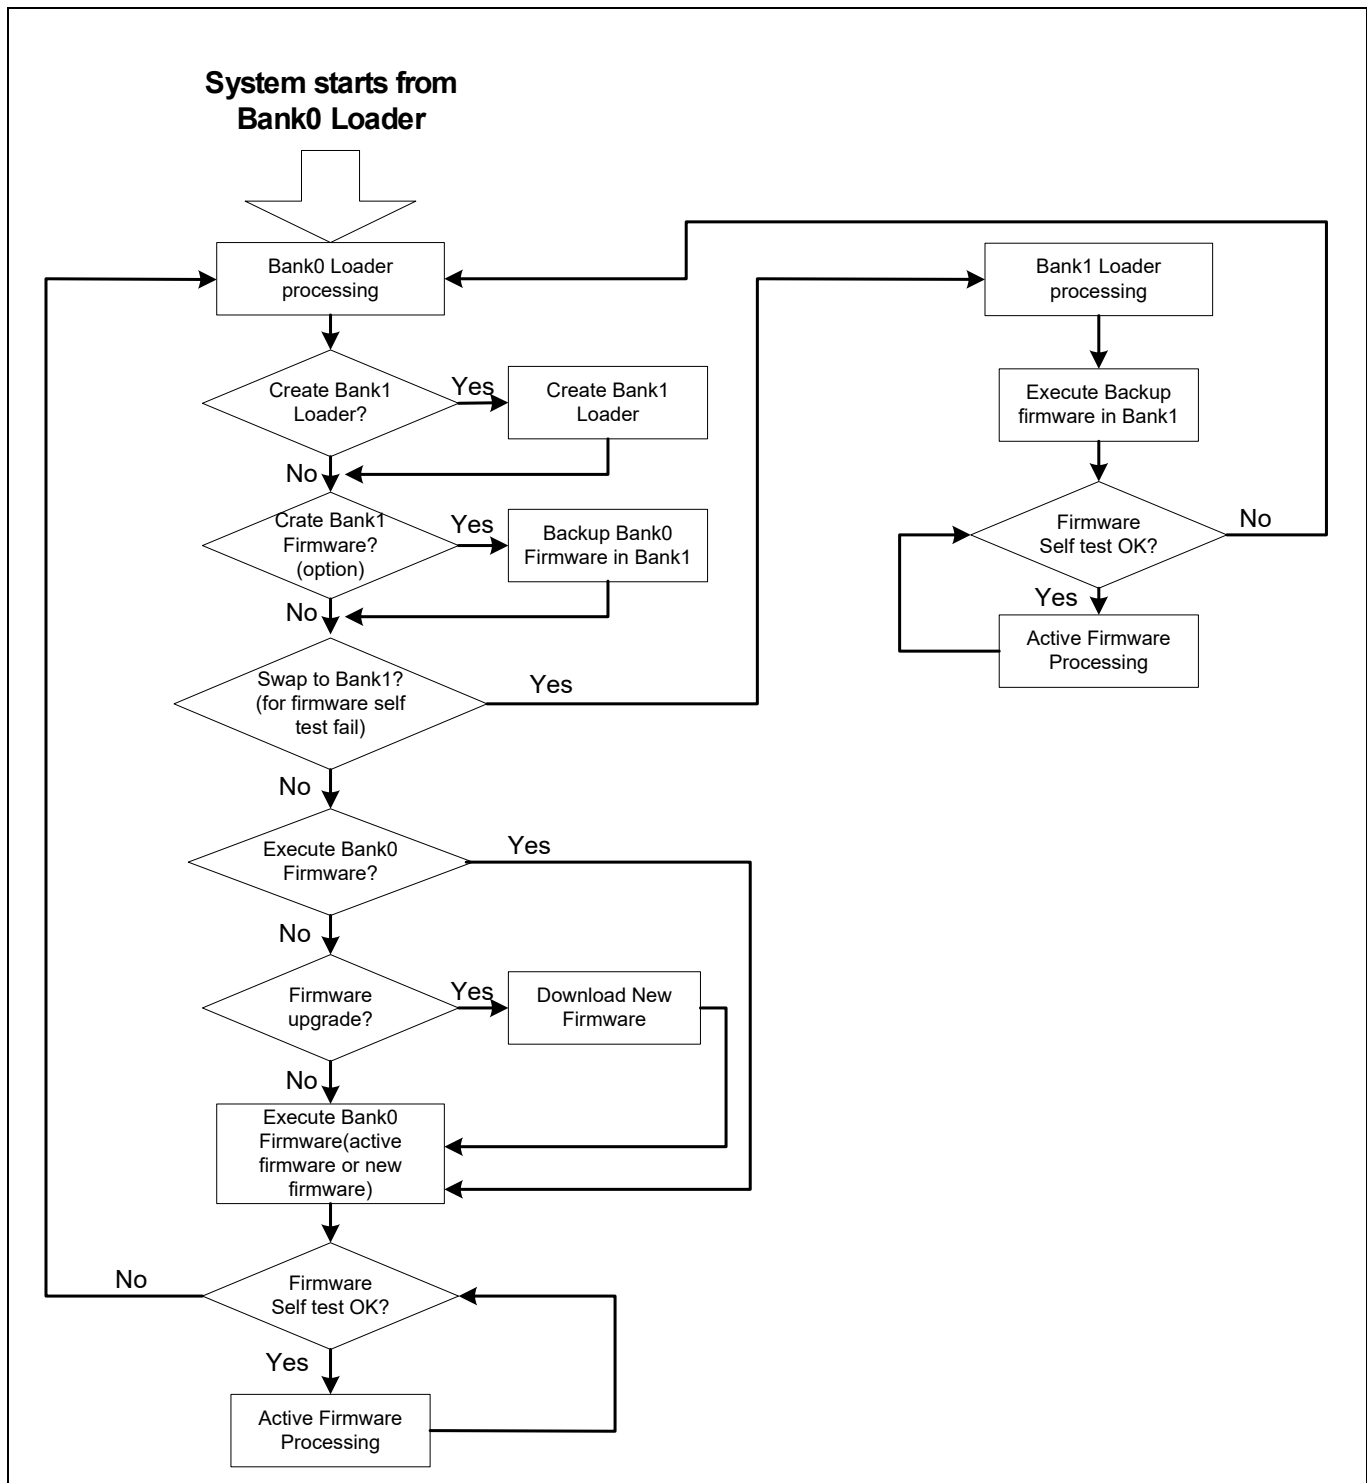

M2354 BSP provides a firmware upgrade application sample code in:  
 \bsp\SampleCode\StdDriver\FMC\_FwUpgradeApplication

This sample code implements a firmware upgrade application under the Dual Bank APROM architecture of the M2354. There are three main programs:

- **BackupApp:**  
 A backup program which can be executed correctly. It is placed in the program execution area of APROM Bank1, which is the Bank1 App base in the figure below.
- **Loader:**  
 A program which performs the control flow of system startup and firmware upgraded. It is placed at the starting address of APROM Bank0, which is the Loader base in the figure below.
- **App:**  
 An executable program that is placed in the program execution area of APROM Bank0, which is the Bank0 App base in the figure below; it may be active firmware or new firmware.

The system control flow is as follows:

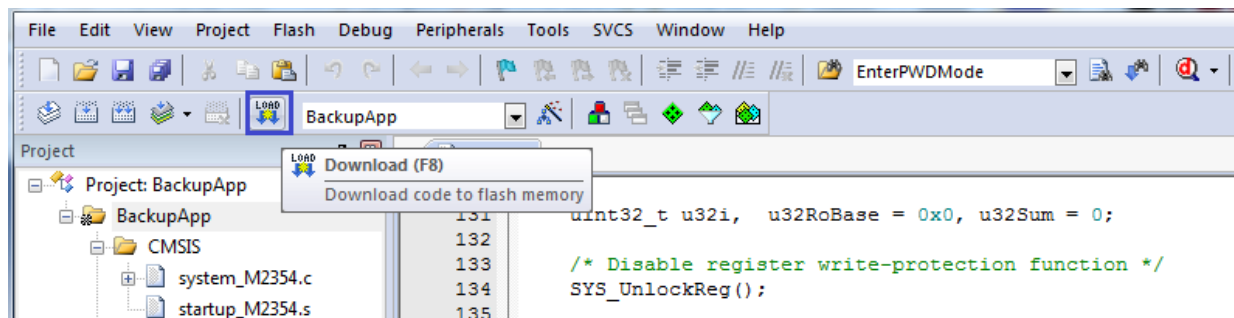

## 2 The Operation of Firmware Upgrade Sample Code

Before executing the program, first define the firmware naming used in the operation steps:

- Active firmware :  
The firmware that was initially placed in the Bank0 App area is also the firmware that the system executes under normal condition.
- New firmware :  
The new firmware loaded in firmware upgrade process.
- Backup firmware :  
A firmware that allows the system to resume the normal execution when active firmware or new firmware fails to executed.

Then start the execution of the program. First, load the backup executable program into the program execution area of Bank1.

In \bsp\SampleCode\StdDriver\FMC\_FwUpgradeApplication\BackupApp\KEIL, open the project BackupApp.uvprojx. After compiling done, click the “LOAD” button to load the backup firmware into the firmware execution area of Bank1. As shown in the figure below:

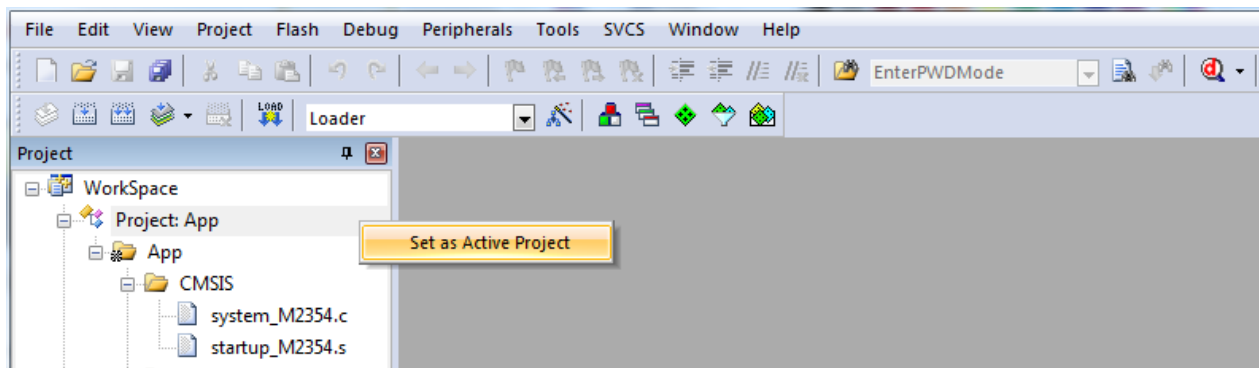

Then back to \bsp\SampleCode\StdDriver\FMC\_FwUpgradeApplication , open the project FMC\_FwUpgradeApplication.uvmpw. This project has two targets: Loader and App. First select the Loader target. As shown in the figure below:

After compiling done, click the “LOAD” button to load the Loader into the Bank0 Loader execution area. As shown in the figure below:

Then select the App target. As shown in the figure below:

After compiling done, click the “LOAD” button to load the App into the Bank0 App execution area. As shown in the figure below:

After the three programs being downloaded, press the reset button on the M2354 to start the system. When the system is started for the first time, the loader of Bank1 will be created for Bank Swap to execute Backup firmware when the firmware upgrade fails. After the Bank1 Loader is created, a dialog message will appear, allowing the user to decide whether to execute Bank0 firmware (Active firmware). As shown in the figure below:

```
COM42:115200baud - Tera Term VT
File Edit Setup Control Window KanjiCode Help

+-----+
| Boot from 0x00000000 |
+-----+

BANK0 Loader processing

Loader0 checksum: 0xc5fe53d7
Loader1 checksum: 0x1b43eabd
App0 checksum: 0xe5172f5d
App1 checksum: 0x964f37a9

Firmware CRC in [0x7f800] is [0xffffffff]
Update Firmware CRC in [0x7f800] is [0xe5172f5d]
Backup Firmware CRC in [0x7f808] is [0xffffffff]
Update Firmware CRC in [0x7f808] is [0x964f37a9]

Create BANK1 Loader...
Create Bank1 Loader completed!

Execute BANK0 APP? [y/n]
█
```

If user selects to execute the active firmware, the system starts the active firmware and a dialog message appears, allowing the user to select to test the success or failure condition. As shown in the figure below:

```
Execute BANK0 APP? [y/n]
█

+-----+
| Boot from 0x00008000 |
+-----+

BANK0 APP processing (Active firmware)

Selt test pass? y/n
```

If user selects to test the successful execution of the firmware, a successful message will be shown and the active firmware will continue to run. As shown in the figure below:

```
+-----+
|  Boot from 0x00008000  |
+-----+

BANK0 APP processing (Active firmware)

Self test pass? y/n

Self test pass!!!

Firmware processing.... cnt[999]
```

If user selects to test the failure of firmware execution, a failure message will be shown. After Watch Dog determines that the firmware has caused the system to stall for more than its timeout, Watch Dog restarts the Loader. After the Loader is started, it is determined that the execution of the Bank0 firmware has failed, so the user presses any key to execute Bank Swap, and returns to the Backup firmware of Bank1 to execute. As shown in the figure below:

```
+-----+
|  Boot from 0x00008000  |
+-----+

BANK0 APP processing (Active firmware)

Self test pass? y/n

Self test fail!!!

Enter power down...

+-----+
|  Boot from 0x00000000  |
+-----+

BANK0 Loader processing

Loader0 checksum: 0xc5fe53d7
Loader1 checksum: 0xc5fe53d7
App0 checksum: 0xe5172f5d
App1 checksum: 0x964f37a9

Firmware CRC in [0x7f800] is [0xe5172f5d]

Backup Firmware CRC in [0x7f808] is [0x964f37a9]

=== System reset by WDT time-out event ===
Any key to swap back to backup FW
```

The execution of Backup firmware is shown in the figure below :

```
+-----+
|  Boot from 0x00008000  |
+-----+

BANK1 APP processing (Backup firmware)

GetSum = 0x964f37a9, Keep Sum = 0x964f37a9

Self test pass!!!

Firmware processing.... cnt[999]
```

The above is the operation flow of executing Active firmware. The following describes how to update the firmware. First, start from the Loader and ask the user whether to execute the Bank0 App. At this time, user must select not to execute the Bank0 App, so that the program continues to execute in the loader. As shown in the figure below:

```
+-----+
|  Boot from 0x00000000  |
+-----+

BANK0 Loader processing

Loader0 checksum: 0xc5fe53d7
Loader1 checksum: 0xc5fe53d7
App0 checksum: 0xe5172f5d
App1 checksum: 0x964f37a9

Firmware CRC in [0x7f800] is [0xe5172f5d]

Backup Firmware CRC in [0x7f808] is [0x964f37a9]

Execute BANK0 APP? [y/n]
```

Then a dialog message will appear to let user select whether to update the firmware. As shown in the figure below:

```
Execute BANK0 APP? [y/n]

Download new firmware? [y/n]
```

When user selects to update the firmware, the Xmodem transmission start character 'C' will appear. As shown in the figure below:

```
Download new firmware? [y/n]

Bank0 processing, download data to Bank0 APP Base.

CCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCC
```

Then select “File→Transfer→XMODOM→Send” in the UART window to start Xmodem transmission. As shown in the figure below:

A window of “XMODEM Send” will appear, then select NewApp.bin provided in Sample code (located in \ bsp \ SampleCode \ StdDriver \ FMC\_FwUpgradeApplication). As shown in the figure below:

After double-clicking on the bin file, the file transferring will be started. As shown in the figure below:

After the transfer is completed, return to the original debug window, and a "Firmware download completed!!" message will appear, indicating that the firmware update is complete. As shown in the figure below:

```
Xomdem transfer done!
Total trnasfer size is 10496

Firmware download completed!!

Any key to execute new firmware
█
```

After upgrading the firmware, press any key to execute new firmware. As shown in the figure below:

```
+-----+  
| Boot from 0x00008000 |  
+-----+  
  
BANK0 APP processing (New firmware)  
  
Self test pass? y/n
```

The execution test of new firmware is the same as the previously described Active firmware. User can select to test the successful or failed firmware execution.

## Revision History

Date	Revision	Description
2020.07.07	1.00	1. Initially issued.

## Important Notice

Nuvoton Products are neither intended nor warranted for usage in systems or equipment, any malfunction or failure of which may cause loss of human life, bodily injury or severe property damage. Such applications are deemed, "Insecure Usage".

Insecure usage includes, but is not limited to: equipment for surgical implementation, atomic energy control instruments, airplane or spaceship instruments, the control or operation of dynamic, brake or safety systems designed for vehicular use, traffic signal instruments, all types of safety devices, and other applications intended to support or sustain life.

All Insecure Usage shall be made at customer's risk, and in the event that third parties lay claims to Nuvoton as a result of customer's Insecure Usage, customer shall indemnify the damages and liabilities thus incurred by Nuvoton.
